Background

CD33, a type I transmembrane protein, is a sialic acid-binding Ig-like lectin (Siglec-3) of the Ig superfamily, and human CD33 binds preferentially to alpha-2, 6-linked sialic acid. Upon binding to its ligands CD33 transduces an inhibitory signaling through the immunoreceptor tyrosine-based inhibitory motif (ITIM) in its intracellular domain, inhibiting cellular function such as phagocytosis. In addition, CD33 is also involved in other processes, such as adhesion. Due to its exclusive expression on hematopoietic cells, particularly the myeloid lineage and their progenitors, CD33 has been actively pursued as a therapeutic target against acute myeloid leukemia (AML). CD33 may also be involved in Alzheimer's Disease.

Validation Data

Flow cytometry: 1×10^6 MCF7 cells (negative control, left) and THP-1 cells (right) were surface-stained with APC Rabbit anti-Human CD33 mAb (A23590, 5 μ l/Test, orange line) or APC Rabbit IgG isotype control (5 μ l/Test, blue line). Non-fluorescently stained cells were used as blank control (red line).

Flow cytometry: 1×10^6 THP-1 cells were surface-stained with APC Rabbit IgG isotype control (5 μ l/Test, left) or APC Rabbit anti-Human CD33 mAb (A23590, 5 μ l/Test, right).
