

Leukemia Probes

FOR PEDIATRIC ALL RESEARCH

Acute lymphoblastic leukemia (ALL) makes up 75% of childhood leukemia diagnoses.¹ Treatment of the disease represents one of the greatest success stories in cancer research to date: since the 1960s, the survival rate has climbed from less than 10% to over 90%.² Despite this remarkable progress, a few high-risk subgroups still suffer poor clinical outcome. These groups are characterized primarily by their genetic profiles, with certain chromosomal lesions conferring a higher risk of disease progression.³ Understanding the role of these mutations in ALL development will continue to serve as an active area of investigation in the research and clinical communities.

Interested in conducting your own ALL research?

Empire Genomics' pediatric ALL FISH panel detect genetic aberrations frequently found in the disease. For more information, and to browse our complete catalog of disease panels, please visit our website.
