New Bioactive Proteins

Abnova's new bioactive proteins offer exceptional purity and confirmed bioactivity, making them indispensable for various research applications. These proteins, which include CD Proteins, MHC Proteins, Immune Checkpoint Proteins, FGFR Family Proteins, VLP-Displayed Antigens, and other targets, are produced using HEK293 mammalian expression systems to maintain their natural conformation and functionality. All bioactive proteins undergo functional assays to confirm their activity. Through rigorous HPLC analysis, all products achieve over 95% purity. Additionally, the endotoxin levels are less than 1EU/ μ g detected by the LAL method, ensuring that Abnova's bioactive proteins meet the highest standards for research and therapeutic development.

CD Proteins

CD proteins, or Cluster of Differentiation proteins, are cell surface molecules that serve as markers to distinguish between different cell types in the immune system. These proteins are crucial in immune cell communication, activation, and differentiation. CD proteins are commonly used in immunophenotyping to identify and classify immune cells, such as T cells, B cells, and natural killer cells. They are essential tools in immunological research, diagnostics, and therapeutic applications, enabling the study of immune responses and the development of targeted therapies.

MHC Proteins

MHC (Major Histocompatibility Complex) proteins are fundamental to the adaptive immune response. TCR proteins on T cells bind to these MHC-peptide complexes, initiating immune reactions. MHC proteins are critical for studying immune recognition, autoimmunity, and developing immunotherapies, including vaccines and cancer treatments. To support MHC-related research, Abnova uses a protein engineering platform and HEK293 expression systems, ensuring MHC monomers and tetramers retain their natural conformation and high biological activity. We offer a wide range of MHC proteins, essential for advanced immunological research.

Immune Checkpoint Proteins

Immune checkpoint proteins are regulators of the immune system that maintain self-tolerance and prevent autoimmunity by acting as "brakes" on the immune response, ensuring it does not become overactive. In cancer therapy, inhibitors targeting these proteins can release these brakes, allowing the immune system to attack cancer cells more effectively. Abnova has developed a series of high-purity bioactive immune checkpoint proteins, which are pivotal in the development of immuno-oncology therapies that harness the body's immune system to combat cancer.

FGFR Family Proteins

FGFR (Fibroblast Growth Factor Receptor) family proteins are a group of receptor tyrosine kinases that play crucial roles in cell growth, differentiation, and angiogenesis. They are involved in various developmental processes and tissue repair mechanisms. Aberrant FGFR signaling is associated with numerous diseases, including cancers, making these proteins important targets for therapeutic intervention. Abnova has developed a series of recombinant FGFR family proteins, covering different subtypes, to support research and therapeutic development.

VLP-Displayed Antigens

Virus-like particle (VLP)-displayed antigens are innovative tools in vaccine development and immunotherapy. Abnova's VLP-displayed antigens effectively present target proteins, including full-length multipass transmembrane proteins, in their natural configuration. These non-infectious VLPs mimic the structure of viruses, significantly boosting immune responses. They are ideal for applications such as immunization, antibody screening, *in vivo* pharmacokinetic analysis, CMC method development, and analytical testing including ELISA and SPR. This versatility ensures they meet various experimental demands, providing a powerful solution for advanced immunological research.
